

### General health by Indicator and Time, 2005, 2014 and 2018

	2005	2014	2018
Percentage of repondents with very good or good selfrated health (pct.)	64,4	59,2	59,0
Good quality of life (pct.)	80,3	90,9	88,5
Social inequality in heavy episodic drinking (concentration index)	0,1	0,1	-
Social inequality in smoking (concentration index)	0,1	0,1	0,1
Number of persons per room	1,1	1,1	1,1

Indicators for public health in the Greenlandic Health Survey. Weighted to population in 2014.

Indicator:

Footnote: Social inequality in health is measured by the concentration index, which is a suitable method to measure inequality in a population. The index is generated by comparing health conditions (in this case heavy episodic drinking and smoking) with for instance income, level of education or a prosperity index. A high concentration index indicates a high level of social inequality.
