. missing

Statistical unit: person (dwelling population).

Income concept: Household-dwelling unit's disposable monetary income (incl. sales profits) per consumption unit.

Consumption unit scale: Eurostat's equivalence scale (1.0 - 0.5 - 0.3).

The table data have been calculated based on total data and they cannot be compared with the sample-based data on low income (see the concepts and definitions and the quality description of income). Figures on children at risk of poverty are published only from 2010 onwards and on persistent risk of poverty from 2013 onwards. The income concept is not fully comparable prior to 2009 concerning child support and child maintenance allowance paid by the Social Insurance Institution. In this respect, the change to the income concept has an impact especially on the comparability over time of the at-risk-of-poverty rate of children, but it does not significantly impact the risk of poverty in the total population. More detailed information about the change to the income concept in the quality description.

Information: Dwelling population, persons
