Regional life expectancies are calculated for a three-year period. Thus, even the smallest regions receive sufficiently comprehensive basic data for calculating mortality and survival rates, and the effect of random variation on the results is smaller.

Region: These statistics apply the regional division of 1 January 2023 to the whole time series.

Information: The number of years that a newborn would live provided that the rate of mortality remains unchanged. Life expectancy is an age-standardised indicator that describes the level of mortality observed during the calculation period.
