Total fertility ²⁾						2,496	2,244	2,482	2,599	2,339

Note: 1) Liveborn children per 1,000 women (the age-specific birth rate) which up until 1979 were recorded as total averages for each five-year age group, have since 1980 been computed as simple averages of the quotients for the individual one-year age group. Also, women under 15 years of age have been included in the 15-year age group.

2) The figure indicates the number of children which 1,000 women would give birth to if none of them were to die before the age of 50 and provided that the birth rate for each age group was the same as the one found in the calendar year in question.
