## Symbol legend:

- Not applicable
   E Use with caution
   F Too unreliable to be published

- Footnotes:

  1. Source: Statistics Canada, Canadian Community Health Survey (CCHS 3.1), 2005. Due to changes in the questionnaire introduced in 2005, these data are not comparable to the CANSIM table 105-0112.

  2. Aboriginal population includes those people living in Canada who identified themselves or their cultural and/or racial background as North American Indian, Métis or Inuit.

  3. Population aged 12 and over who rate their own health status as being either excellent or very good. Self-rated health is an indicator of overall health status. It can reflect aspects of health not captured in other measures, such as incipient disease, disease severity, aspects of positive health status, physiological and psychological reserves and social and mental function.

- Population aged 12 and over who rate their own mental health status as being excellent or very good. Self-reported mental health provides a general indication of the population suffering from some form of mental disorder, mental or emotional problems, or distress, not necessarily reflected in self-reported (physical) health.

  Population aged 12 and over who report that they have been diagnosed by a health professional as having arthritis or rheumatism.
- 6. Arthritis or rheumatism includes rheumatoid arthritis and osteoarthritis, but excludes fibromyalgia

- Population aged 12 and over who report that they have been diagnosed by a health professional as having diabetes
   Diabetes includes females 15 and over who have been diagnosed with gestational diabetes.
   Population aged 12 and over who report that they have been diagnosed by a health professional as having asthma.
- 10. Population aged 12 and over who report that they have been diagnosed by a health professional as having high blood pressure.

  11. Population aged 12 and over who report that they have been diagnosed by a health professional as having high blood pressure.

  12. Refers to injuries which are serious enough to limit normal activities. For those with more than one injury in the past 12 months, refers to "the most serious injury", as identified by the respondent.
- 13. Population aged 12 and over who report being limited in selected activities (home, school, work and other activities) because of a physical condition, mental condition or health problem which has lasted or is expected to last 6 months or longer. "Participation and activity limitation" was previously referred to as "Activity limitation".

  15. Population aged 12 and over who report being a current smoker (daily or occasional).

- Daily smokers refers to those who reported smoking cigarettes every day.
   Occasional smokers refers to those who reported smoking cigarettes occasionally. This includes former daily smokers who now smoke occasionally.
   Non-smoking population aged 12 and over who reported that at least one person smokes inside their home every day or almost every day.
- 19. Smoking includes cigarettes, cigars and pipes.
- 20. Non-smoking population aged 12 and over who reported being exposed to second-hand smoke in private vehicles and/or public places on every day or almost every day in the past month.

  21. Population aged 12 and over who reported there are restrictions against smoking in the home and that the restriction is that smokers are asked to refrain from smoking in the house.
- 22. Employed population aged 15 to 75 who reported that smoking is completely restricted at their place of work.
- 23. Population aged 12 and over who reported being either a current or former smoker and who reported smoking their first whole cigarette between the ages of 5 and 14.
  24. Population aged 12 and over who reported never having a drink.
- 25. Population aged 12 and over who reported having at least 1 drink in the past 12 months and who reported having 5 or more drinks on one occasion, 12 or more times in the past 12 months
- 26. Population aged 12 and over who reported naving at least 1 annix in the past 12 months and wor reported naving at least 1 annix in the past 12 months and wor reported naving at least 1 annix in the past 12 months and wor reported naving at least 1 annix in the past 12 months.
   26. Population aged 12 and over reporting being physically active or moderately active, based on their responses to questions about the frequency, duration and intensity of their participation in leisure-time physical activity.
   27. Respondents are classified as active, moderately active or inactive based on an index of average daily physical activity over the past 3 months. For each leisure time physical activity engaged in by the respondent, an average daily energy expenditure is calculated by multiplying the number of times the activity was performed by the average duration of the activity by the energy cost (kilocalories per kilogram of body weight per hour) of the activity. The index is calculated as the sum of the average daily energy expenditures of all activities. Respondents are classified as follows: 3.0 kcal/kg/day or more = physically active; 1.5 to 2.9 kcal/kg/day = moderately active; less than 1.5 kcal/kg/day = inactive.
   28. Population aged 18 and over who reported their level of life stress as quite a lot.
- 28. Population aged 18 and over who reported their level of life stress as quite a lot.

  29. Body mass index (BMI) is a method of classifying body weight according to health risk. According to the World Health Organization (WHO) and Health Canada guidelines, health risk levels are associated with each of the following BMI categories: normal weight = least health risk: underweight and overweight = increased health risk: obese, class I = high health risk; obese, class II = very high health risk; obese, class III = extremely high health risk.

  30. Body mass index (BMI) is calculated by dividing the respondent's body weight (in kilograms) by their height (in metres) squared.

  31. A definition change was implemented in 2004 to conform with World Health Organization (WHO) and Health Canada guidelines for body weight classification. The index is calculated for the population aged 18 and over, excluding pregnant females and persons less than 3 feet (0.914 metres) tall or greater than 6 feet 11 inches (2.108 metres).

- 32. According to the World Health Organization (WHO) and Health Canada guidelines, the index for body weight classification is: less than 18.50 (underweight); 18.50 to 24.99 (normal weight); 25.00 to 29.99 (overweight); 30.00 to 34.99 (obese, class II); 35.00 to 39.99 (obese, class III); 40.00 or greater (obese, class III).
- 33. Body mass index (BMI) for youth is different from that of adults as they are still maturing. This variable classifies the measured BMI of children aged 12 to 17 as "obese" or "overweight" according to the age- and sex-specific BMI cut-off points as defined I others. The Cole cut-off points are based on pooled international data (Brazil, Great Britain, Hong Kong, Netherlands, Singapore and United States) for BMI and linked to the internationally accepted adult BMI cut-off points of 25 (overweight) and 30 (obes Respondents who do not fall within the categories of "obese" or "overweight" (as defined by Cole and others) have been classified by the Canadian Community Health Survey (CCHS) as "neither overweight nor obese".

  34. Population aged 12 and over who describe their sense of belonging to their local community as very strong or somewhat strong. Research shows a high correlation of sense of community-belonging with physical and mental health. ecific BMI cut-off points as defined by Cole and
- 35. Population aged 12 and over were asked to report whether they had a regular medical doctor
- 36. Population aged 12 and over who have consulted with a medical doctor in the past 12 months.
   37. Medical doctor include family or general practitioners as well as specialists such as surgeons, allerg
   38. Population aged 12 and over who have consulted with a dental professional in the past 12 months. ns, allergists, orthopaedists, gynaecologists or psychiatrists. For population aged 12 to 17, includes pediatricians
- Dental professionals include dentists or orthodontists.
- 40. Population aged 12 and over who have consulted with an alternative health care provider in the past 12 months.
  41. Alternative health care providers include massage therapists, acupuncturists, homeopaths or naturopaths, Feldenkrais or Alexander teachers, relaxation therapists, biofeedback teachers, rolfers, herbalists, reflexologists, spiritual healers, religious healers and others.
- 42. Population aged 12 and over who reported having had their last influenza immunization (flu shot) less than one year ago
- 43. Females aged 50 to 69 who reported having had their last mammogram for routine screening or other reasons within the last 2 years
  44. Screening by mammography is an important strategy for early detection of breast cancer.
- 45. Females aged 18 to 69 who reported having had their last Pap smear test within the last 3 years
- 46. Pap tests (Papanicolaou) detect pre-mailignant lesions before cancer of the cervix develops.

  47. When comparing estimates, it is important to use confidence intervals to determine if differences between values are statistically significant. Confidence intervals describe sampling variability and give an indication of the precision of a given estimate.
- 48. Bootstrapping techniques were used to produce the coefficient of variation (CV) and 95% confidence intervals (CIs).
- 49. Data with a coefficient of variation (CV) from 16.6% to 33.3% are identified by an (E) and should be interpreted with caution 50. Data with a coefficient of variation (CV) greater than 33.3% were suppressed (F) due to extreme sampling variability.
- 51. The data expressed as proportions (%) in these tables are calculated using the total population of the selected group as the denominator
- 52. The following standard symbols are used in this Statistics Canada table: (...) for figures not available for a specific reference period and (...) for figures not applicable
