Symbol legend:

- ^E Use with caution
- ^F Too unreliable to be published

Footnotes:

1. Source: Aboriginal Peoples Survey 2012.
2. Excludes persons living on Indian reserves or settlements.
3. "Long-term health problems (self-reported)" refers to whether or not a person has reported that a health professional has diagnosed him or her with a long-term or chronic medical condition. Long-term or chronic conditions are those which have lasted, or are expected to last, six months or more. Respondents aged 6 to 11 were asked a different series of questions on long-term health problems compared with the population age 12 and over, although a few of the long-term health problems asked about were common to both age groups.
4. Aboriginal identity includes persons living off reserve who reported being an Aboriginal person, that is, First Nations (North American Indian),

Métis or Inuk (Inuit) and/or those who reported Registered or Treaty Indian status, that is registered under the Indian Act of Canada, and/or those who reported membership in a First Nation or Indian band. The sum of the categories included in this variable is greater than the total population estimate for Aboriginal identity because a person may have reported more than one Aboriginal identity: for example, a person could self-identify as both First Nations and Métis.

5. Atlantic includes Newfoundland and Labrador, Prince Edward Island, Nova Scotia, and New Brunswick.
6. Registered or Treaty Indian status refers to whether or not a person reported being a Registered or Treaty Indian. Registered Indians are persons who are registered under the Indian Act of Canada. Treaty Indians are persons who belong to a First Nation or Indian band that signed treaty with the Crown. Registered or Treaty Indians are sometimes also called Status Indians.
7. Proxy reporting was used in the 2012 Aboriginal Peoples Survey for most children aged 6 to 14 years, nearly half of youth aged 15 to 17 years and for adults in certain specific situations (for example when the selected adult was not able to answer for health related reasons, due to a language barrier, or because the selected respondent was going to be away from home for the duration of the survey.)
8. Respondents aged 12 and over were asked a series of questions on long-term health problems; each question asked whether the respondent had a specific long-term health problem, to which the respondent or proxy could answer "Yes" or "No". The sum of the categories of specific long-term health problems is greater than the total population estimate for "With long-term health problems" because a person may have reported more than one long-term health problem.
9. All percentages for the variable "long-term health problems (self-reported)" are calculated using the number of persons in "total, long-term health problems (self-reported)" as denominator.
10. Other long-term health conditions include diabetes (with the exception of gestational diabetes; that is, diabetes that had only been diagnosed during pregnancy), chronic bronchitis, emphysema, chronic obstructive pulmonary disease (COPD), heart disease, intestinal or stomach ulcers, bowel disorder, mood disorder, anxiety disorder, learning disability, Attention Deficit disorder (ADD), or any other long-term physical or mental health condition.
11. "Not specified if has a long-term health problem" consists of item non-response ("Refusal", "Don't know", and "Not stated").
12. Bootstrapping techniques were used to produce the coefficient of variation (CV).
13. Data with a coefficient of variation (CV) from 16.6% to 33.3% are identified by an (E) and should be interpreted with caution.
14. Data with a coefficient of variation (CV) greater than 33.3% were suppressed (F) due to extreme sampling variability.
