Per cent of households with an income under 60 per cent of median equivalised income.

The total disposable income of a household consists of personal income received by all household members plus income received at household level. Missing income information is imputed. Disposable income consists of :

- all income from work (employee wages and self-employment earnings)
- private income from investment and property
- transfers between households
- all social transfers received in cash including gold-age pensions

To take into account the impact of differences in household size and composition, the total disposable household income is equivalised. The equivalised income attributed to each member of the household is calculated by dividing the total disposable income of the household by the equivalisation factor. In this case a weight of 1.0 to the first person aged 14 or more, a weight of 0.5 to other persons aged 14 or more and a weight of 0.3 to persons aged 0-13.
