# Abortions (NHCC) - *per 1000 women*

## Description

Number of abortions performed per year per 1000 women in the shown age group. All abortions are included, regardless of in what stage of the pregnancy the abortion was performed.

Two measures are available:

1. Per 1000 = Number of abortions performed per year per 1000 women.

2. Ratio (Norway = 100) = Ratio between the county's percentage and the national percentage for a given year. Examples; ratio = 130 means that the county's percentage is 30% higher than the national level. A ratio of 87 means that the county's percentage is 13% lower than the national level.

## Rationale for indicator

Abortion statistics is important to follow the trend in discontinuation of pregnancies. The percentage of discontinued pregnancies has been decreasing for the last decade, especially among teenagers.

## Source

Norwegian Institute of Public Health

## Collection

As of 1.1.2006, the Norwegian Institute of Public Health is solely responsible for the Abortion Register. During 1999-2005, responsibility was shared between Statistics Norway and the Norwegian Institute of Public Health. Data on abortions is sent from local health services performing the abortions via the Chief County Medical Officer. New registrations should be sent at least once a week. These include information such as the pregnancy duration, legal act, method of abortion, woman's age and county of residence. Nationally representative data.

## Interpretation and sources of error

For technical reasons, the data series has two parts. Data for the years before 1986 are static, based on an earlier version of the Abortion registry (previous to the 2014 restructuring). These values are calculated using a slightly different definition for the denominator (mid-year population). All data starting 1986 originate in the present version of the registry. When updating, data can include corrections for the last two years. In the Abortion registry proper, all data (i.e. data for all years) are corrected if necessary.

## Data quality

Good data quality, assuming complete information is delivered by the local health services which perform the abortions.

## When numbers are missing

Statistics based on fewer than 3 cases is hidden to protect the identity of the patients. Figures are also hidden when the population group in which the cases originate, is smaller than 10 persons. If more than 20 per cent of the cases in a time series are hidden due to the abovementioned reasons, the complete time series is hidden to avoid giving a skewed impression.

The complete time series is also hidden if more than 50 per cent of the values in the series are based on 6 or fewer cases. In this case, the figures are regarded as too uncertain.

For technical reasons, 1986 is the first year to which these criteria are applied. If the time series from 1986 is hidden due to these criteria, the years before 1986 are also hidden.

In 1994 and 1995 data is only available for all ages combined (15-49 years) because date of birth of the mother was not registered for these two years, so exact age of the mother is therefore unknown.

# Abortions (NHCC) - *per 1000 women*

## Time periods

1979-2018. In 1994 and 1995 data is only available for all ages combined (15-49 years).

## Geographical level

Country, health regions, counties, 4 largest cities: Oslo (presented both as county and city), Trondheim, Bergen, Stavanger.

## Gender

Women

## Age groups

15-49 years, 15-19, 20-24, 25-29, 30-34, 35-39, 40-44 and 45-49 years

## Frequency of updates

Annually

## Last updated
