Children living in low income households by county limits for low income (NHC)

Description

Children living in households with incomes below 60% of each county's median income, based on the EU scale. The indicator also excludes persons with gross capital of 1 G or more. Annual figures.

The EU scale is an equivalence scale used to compare households of different size and composition. Different equivalence scales emphasize the economies of scale differently. The EU scale is widely used, and according to the scale a household of two adults needs to have 1.5 times the income of a single person to have the same financial situation. Children increase consumption weights by 0.3 so that a household of two adults and two children needs to have an income that is $(1 + 0.5 + 0.3 + 0.3)$ times that of a single person to be as well off economically according to the EU scale.

Gross capital: "Includes bank deposits, shares in equity, bond and money market funds, shares, bonds and other securities"

1 G: The basic amount in the National Insurance Scheme. This was equivalent to NOK 89 502 in 2015.

Student households are not included.

Three measures are available. Use the Measure button to select:

1. Number of people
2. Per cent = Percentage of the population
3. Ratio (Norway = 100) = Ratio between the county's percentage and the national percentage for a given year. Examples; ratio = 130 means that the county's percentage is 30% higher than the national level. A ratio of 87 means that the county's percentage is 13% lower than the national level

Rationale for indicator

Income and economy are fundamental determinants of health, and research has shown that there is a correlation between income level and health. Low income increases the likelihood of poor self-reported health, illness and premature death.

Source

Statistics Norway (SSB)

Collection

The statistics are based on administrative registers from among others the Directorate of Taxes, the Norwegian Labour and Welfare Administration, the Norwegian State Housing Bank and the State Educational Loan Fund.

The statistics show actual households and is derived from formal households. Actual household refers to those who live together daily and have a common economy. Other information is used to get more cohabiting couples registered as a common household, and data from the Norwegian Labour and Welfare Administration is used to identify more institutional residents.

Interpretation and sources of error

There are differences in economic structure between counties. The basis for the statistics is the national median income for households. There are variations between counties related to expenses, such as property. Variations between counties in the percentage of people with low income are therefore not a simple expression of differing welfare. Age structure in the various counties is also important. In the interpretation the age structure of the county should be taken into consideration, in particular the proportion of (minimum income) pensioners.

When interpreting the statistics, one can account for differences between counties by selecting 50 or 60 per cent as the threshold value, based on whether the county median income is higher or lower than that of the country.

Data quality

Data are based on counts of the whole population, and data quality is considered to be relatively high. Some errors in collecting and processing the data are inevitable, such as coding errors, revision errors or calculation errors. A considerable amount of work has been done to minimize these errors, and Statistics Norway considers these errors to be relatively insignificant.

When numbers are missing

Statistics based on fewer than 3 cases are hidden for privacy reasons. The same applies if the population segment that cases are taken from is smaller than 10.

If more than 20 per cent of the numbers in a time series are hidden for privacy reasons, the entire series is hidden to avoid creating a biased impression of the situation in the county. Time series are also hidden where more than 50 per cent of the numbers in the time series are based on 6 or fewer cases. This is done to hide time series that are based on a too small numerical basis.
